

# Risk assessment workbook for mines

# Metalliferous, extractive and opal mines, and quarries

IGA-019

December 2009

### Disclaimer

The compilation of information contained in this document relies upon material and data derived from a number of third party sources and is intended as a guide only in devising risk and safety management systems for the working of mines and is not designed to replace or be used instead of an appropriately designed safety management plan for each individual mine. Users should rely on their own advice, skills and experience in applying risk and safety management systems in individual workplaces.

Use of this document does not relieve the user (or a person on whose behalf it is used) of any obligation or duty that might arise under any legislation (including the *Occupational Health and Safety Act 2000*, any other Act containing requirements relating to mine safety and any regulations and rules under those Acts) covering the activities to which this document has been or is to be applied.

The information in this document is provided voluntarily and for information purposes only. The New South Wales Government does not guarantee that the information is complete, current or correct and accepts no responsibility for unsuitable or inaccurate material that may be encountered.

Unless otherwise stated, the authorised version of all reports, guides, data and other information should be sourced from official printed versions of the agency directly. Neither Industry & Investment NSW, the New South Wales Government, nor any employee or agent of the Department, nor any author of or contributor to this document produced by the Department shall be responsible or liable for any loss, damage, personal injury or death howsoever caused.

Users should always verify historical material by making and relying upon their own separate enquiries prior to making any important decisions or taking any action on the basis of this information.

# OBJECTIVE

This workbook is designed to give the user a starting point to identify and manage hazards at the mine site. It is a step-by-step approach to identify hazards, assess risks and implement controls.

It is consistent with other NSW Mine Safety Operations publications such as the *Risk Management Pocket Guide* and the *General Workplace Inspection Checklist*.

The *Risk Management Pocket Guide* provides a daily prompt for people on the job to develop their understanding and experience by encouraging the daily discipline of managing risks whilst carrying out tasks in the mining and quarrying industries.

This workbook is designed to take those principles from the *Risk Management Pocket Guide* and implement them at the mine site from the front gate to the back gate, prompting the user to look at a wide range of hazards.

This workbook uses a simplified form of a Workplace Risk Assessment and Control (WRAC). It does not cover all hazards and the user should add those hazards not identified in the workbook.

This workbook highlights the prescribed hazards from the *Mine Heath and Safety Regulation* 2007 and the *Occupational Health and Safety Regulation* 2001.

This workbook allows the user to assess the risks from the identified hazards from low to high. This should enable the user to have a better understanding of what hazards have a high risk and thus examine if existing controls used are appropriate or need to be reviewed.

The General Workplace Inspection Checklist can then be used to ensure that the controls put in place are effective, utilised and maintained.

This workbook should be reviewed on a regular basis to ensure that all identified hazards are being effectively and efficiently controlled.

# WHY DO RISK ASSESSMENTS?

Risk assessments will help mine operators to identify high, medium and low risk levels. This is a requirement of the *Occupational Health and Safety Act 2000* (refer Sections 7 & 8). Risk assessments will help to prioritise the risks and provide information on the need to safely control the risks. In this way, mine owners and operators will be able to implement safety improvements.

## WHAT IS RISK ASSESSMENT?

A risk assessment involves a detailed and systematic examination of any activity, location or operational system to identify hazards. The assessment will consider the relationship between the likelihood and potential consequence of the risk of hazards occurring, and to review the current or planned approaches to controlling the hazards. New or improved hazard controls are added where required.

## DEFINITIONS

### 1. Hazard

A hazard is a source of potential harm or a situation with potential to cause harm (AS/NZS 4360 Risk Management).

Identifying hazards and compiling information about them is the first step in planning for safety.

### 2. Prescribed Hazard

The *Mine Health & Safety Regulation 2007* requires mines to conduct OH&S risk assessments in relation to certain high risk, prescribed hazards associated with ground instability, inrush, atmospheric contamination, mine shafts, conveyors, earth moving machinery, fire, explosives, electrical work and mine roads.

If you identify a prescribed hazard, the *Mine Health & Safety Regulation 2007* clause 35 requires you to take into account certain factors that are relevant to the hazard. These factors are:

- (a) the time, place and location of the hazard;
- (b) work organisation relating to the hazard;
- (c) work environment relating to the hazard;
- (d) the skills and experience of persons dealing with the hazard;
- (e) the age of persons dealing with the hazard;
- (f) special needs (temporary or permanent) relevant to the hazard;
- (g) any other factors considered relevant by the operator, by any other employer at the mine, by any employee of the operator or such an employer, or by any representative of any such employee on health and safety issues.

#### 3. Risk

Risk is defined as the chance of something happening that will have an impact upon objectives (AS/NZS 4360 *Risk Management*). In other words, risk is the chance of something happening that will have a negative impact on the health or safety of a person.

Risks are measured in terms of likelihood and consequence.

Risk = Likelihood (Probability) of an occurrence x Consequences of the occurrence

The highest risk levels (i.e. most severe consequences and highest likelihood of occurring) should be controlled or minimised first.

### 4. Workplace Risk Assessment and Control (WRAC)

WRAC is a proactive or pre-event approach to examining any or all parts of the work site to ensure that risks are understood and controlled to a reasonable level. It is 'a participative approach for identifying potential production or maintenance operational losses (MDG1010 Risk Management Handbook for the Mining Industry).'

WRAC is a specific qualitative risk assessment method designed to be applied when an organisation wants to understand its risks and clearly identify the priority or highest risks in its operation.

### 5. Standards

Standards can be taken to mean Australian Standards, International Standards, Guidelines, Legislation, Codes of Practice, even the mine's own set of standards.

### HOW DO I USE THE RISK ASSESSMENT WORKBOOK?

This workbook provides a step-by-step approach to identify hazards, assess risks and allows the user to identify and list controls. The process identifies where a likelihood and consequence of harm could occur to a person in and around the mine. It records specific hazards, possible problems and risks levels.

The workbook consists of 3 stages:

- 1 <u>Cover Sheet</u> and <u>Hazard Type List Prompts and Energies</u>
- 2 Risk Assessment
- 3 Action Planning

It is important that you take the time to read these instructions for the next 3 stages.

# **STAGE 1**

# HAZARD IDENTIFICATION

1. Go to the Cover Sheet and fill in the mine name, date of the assessment, assessors' names and signatures. (See example 1 below). Do not fill in the action plan section until you have completed Stage 2.

	COVE	K SHEET			
RISI	RISK ASSESSMENT WORKBOOK				
Mine Name:		ACME Quarry			
Date:		1 September 2008			
Assessor's Na	ame:	Assessor's Signature:			
John Citizen	,	J. Citizen			
Jane Citizen	en Jane Cítizen				
	Action Pl	an Written:			
Dat	e:

B	y:				
	Example 1	Cover Sheet			

Example 1 Cover Sheet

2. Complete 'TABLE 3 Work Areas' by ticking the boxes that apply at your mine site.

### EXAMPLES

**TABLE 3 Work Areas** (Tick what work areas apply at your mine site)

Example 2 A hard rock quarry that uses explosives, crushes rock, has a laboratory and weighbridge

### TABLE 3 Work Areas (Tick what work areas apply at your mine site)

Example 3 a sand mine that is worked by a front end loader into a sand dune with no workshop, screening plant or weighbridge

### Example 3- TABLE 3 Work Areas (Tick what work areas apply at you mine site)

Example 4 An underground mine that uses explosives, crushes ore or rock, with a workshop, screening plant and weighbridge

3. Now go to <u>Table 4</u> '*Hazard Type List – Prompts and Energies*' which groups hazards with similar properties.

Using this table, tick the hazard types that exist at the mine and complete the relevant section of the hazard type list.

For example if the mine site uses petrol, tick the DUST, CHEMICALS & HAZARDOUS SUBSTANCES box. If the mine does not use explosives then leave the EXPLOSIVES box blank. If a section is not ticked then record why under the "Reason(s) for not ticking". It is good practise to record why any section has not been used e.g. "no explosives on mine site".

### **TABLE 4 - Hazard Type List Prompts & Energies**

<ul> <li>DUST, CHEMICALS &amp; HAZARDOUS SUBSTANCES 23 - 26</li> <li>Chemicals and dusts that can affect health such as silica, asbestos, lead and other dusts.</li> <li>Flammable gases such as acetylene, LPG and methane.</li> <li>Chemical fumes from welding/cutting, grinding, glues, grouts, fuels.</li> <li>Chemicals such as petrol, diesel, oils, degreasers, solvents, chlorine, pesticides, cleaners, paints.</li> </ul>	Page Reason(s) for	Section	Tick if it
<ul> <li>Chemicals and dusts that can affect health such as silica, asbestos, lead and other dusts.</li> <li>Flammable gases such as acetylene, LPG and methane.</li> <li>Chemical fumes from welding/cutting, grinding, glues, grouts, fuels.</li> <li>Chemicals such as petrol, diesel, oils, degreasers, solvents, chlorine, pesticides, cleaners, paints.</li> </ul>	SUBSTANCES 23 - 26	DUST, CHEMICALS & HAZARDOUS SUBST	
Gases such as H2S, CO, CO <sub>2</sub> , NOx etc, Explosive Dusts such as coal and sulphide ore dusts	h such as silica, asbestos, lead and methane. ding, glues, grouts, fuels. degreasers, solvents, chlorine, , Explosive Dusts such as coal	<ul> <li>Chemicals and dusts that can affect health such as and other dusts.</li> <li>Flammable gases such as acetylene, LPG and metha</li> <li>Chemical fumes from welding/cutting, grinding, glues</li> <li>Chemicals such as petrol, diesel, oils, degreasers pesticides, cleaners, paints.</li> <li>Gases such as H2S, CO, CO<sub>2</sub>, NOx etc, Explosive and sulphide ore dusts</li> </ul>	
Image: Second systemELECTRICAL ENERGIES27 - 30	27 - 30	ELECTRICAL ENERGIES	$\checkmark$
<ul> <li>Energy from apparatus such as electrical switchboards, control panels, power points, light fittings, switches, power tools, flexible leads, power boards, generators, etc</li> </ul>	I switchboards, control panels, ver tools, flexible leads, power	<ul> <li>Energy from apparatus such as electrical switchbo power points, light fittings, switches, power tools, f boards, generators, etc</li> </ul>	
<b>EXPLOSIVES</b> 31 - 32	31 - 32	EXPLOSIVES	
Explosive transport, storage and handling     No explosives us     on site	No explosives use on site	Explosive transport, storage and handling	
Example 5		Evampla 5	L

Example 5 (above) shows that the DUST, CHEMICALS & HAZARDOUS SUBSTANCES box is ticked because the mine uses diesel, welds, grinds, etc. The ELECTRICAL ENERGIES box is ticked as the mine uses electricity for power tools and lighting. This particular mine does not use explosives so the EXPLOSIVES box is left blank. "No explosives are used on site" has been recorded.

It is important to look at all aspects of the mine site and include all work places (offices, buildings, mining areas, stockpiles, plant, treatment facilities, etc) and apply each of the hazard types to those areas of the mine.

4. Now go to <u>Table 5 'Work Area versus Hazards'</u> which is a matrix that has been provided to identify the types of hazards that may exist in each work area.

Transfer the tick areas from <u>Table 3 'Work Areas</u>' into the top row of <u>Table 5</u> <u>'Hazards versus Work Area</u>'.

Transfer the tick areas from <u>Table 4</u> '*Hazard Type List – Prompts and Energies*' into the first column of <u>Table 5</u> 'Hazards versus Work Area'

Complete the matrix which will provide a snapshot of hazard types found at your mine.

### **Table 5 Work Area versus Hazard**

Tick the work areas that apply ➔	SURFACE MINE (e.g. quarry, open cut, pit, sand or gravel operation, dredging)	UNDER GROUND MINE (e.g. ground support, access egress ventilation)	FACILITIES (e.g. workshop, fuel, chemical ,explosive storage, generator)	PLANT / TREATMENT FACILITY (e.g. fixed plant, conveyors, crushers, screens, mobile plant, dredges)	ADMINISTRATION (e.g. buildings, structures, weighbridge and other facilities)
Tick the hazards that apply ♥	$\checkmark$		$\checkmark$	$\checkmark$	$\checkmark$
DUST, CHEMICALS & HAZARDOUS SUBSTANCES			V	V	
			$\checkmark$	$\checkmark$	V
EXPLOSIVES					
GRAVITATIONAL ENERGIES			V	V	V
RADIATION ENERGIES, THERMAL ENERGIES AND FIRES			V	$\mathbf{N}$	V
MECHANICAL ENERGIES			V	Ŋ	
PRESSURE (FLUIDS/GASES)			V	V	
			V	V	N

Example 6 Completed TABLE 5

Example 6 shows a quarry that extracts material by ripping and tearing, crushes rock, and has a laboratory and weighbridge. The user has transferred the ticks from TABLE 3 into the top part of Table 5. In this example, SURFACE MINE, SURFACE FACILITIES, PLANT / TREATMENT FACILITY, and ADMINISTRATION have been ticked.

The user has then transferred the ticks from TABLE 4 into the first column in TABLE 5. Notice that in this example, all of the hazards for this quarry have been ticked except EXPLOSIVES as the quarry does not use explosives.

The user then completes the matrix aligning the work areas with the hazards that occur at that particular work area.

Tick the work areas that apply <del>→</del>	SURFACE MINE (e.g. quarry, open cut, pit, sand or gravel operation, dredging)	UNDER GROUND MINE (e.g. ground support, access egress ventilation)	FACILITIES (e.g. workshop, fuel, chemical ,explosive storage, generator)	PLANT / TREATMENT FACILITY (e.g. fixed plant, conveyors, crushers, screens, mobile plant, dredges)	ADMINISTRATION (e.g. buildings, structures, weighbridge and other facilities)
Tick the hazards that apply ♥	$\checkmark$		$\checkmark$	$\checkmark$	$\checkmark$
DUST, CHEMICALS & HAZARDOUS SUBSTANCES	V		V	V	
			V	V	$\checkmark$

The hazards identified for this quarry include DUST, CHEMICALS & HAZARDOUS SUBSTANCES which occur at the SURFACE MINE, FACILITIES and the PLANT / TREATMENT FACILITY. This means that the risk assessment for DUST, CHEMICALS & HAZARDOUS SUBSTANCES from <u>Table 6 'RISK ASSESSMENT</u>' needs to be completed for each work area (i.e.3 times).

It also shows that the hazards for ELECTRICAL ENERGIES occur at the FACILITIES, PLANT / TREATMENT FACILITY and the ADMINISTRATION area. This means that the risk assessment for ELECTRICAL ENERGIES from <u>Table 6</u> (RISK ASSESSMENT' needs to be completed for each work area (i.e. 3 times).

# STAGE 2

## **RISK ASSESSMENT**

<u>Table 6 'RISK ASSESSMENT'</u> includes a list of hazards or prompts; this list is used to help identify the hazards that could occur at the mine. This is the actual risk assessment of the mine site. Space is provided to list other hazards identified at the mine site that are not listed in this workbook.

<u>Table 6 'RISK ASSESSMENT'</u> should be used while physically walking through the identified work areas (from <u>Table 5 'Work Area versus Hazards'</u>).

To complete <u>Table 6 'RISK ASSESSMENT'</u> begin by looking at each of the hazard prompts, located in the first 2 columns. Continue to identify the hazards and resultant problems that **could** occur. That is, problems that are foreseeable and realistic, and based upon a working knowledge of the mine site.

If the hazard or prompt does not exist at your mine site, it would be good practise to write why the hazard or prompt does not exist. (Use column 5 Reason for Selecting the Likelihood).

For example, Dust, Chemicals and Hazardous Substances are used at this site but asbestos is not present, so record next to the asbestos prompt "no asbestos on site".

### Carry out the following steps:

### Hazard Identification:

- 1. Work through the first 2 columns from <u>Table 6 'RISK ASSESSMENT</u>'.
- 2. Decided from the hazard type and the related prompts, listed in the first 2 columns, if they are present or possible at your mine.
- 3. Place a tick in column 3 for each prompt (column 2) that is present or possible.

Note: if you decide that the hazard type and the related prompt does not exist then write your reason(s) why in the adjacent columns (see example on next page).

DU	DUST, CHEMICALS & HAZARDOUS SUBSTANCES Work Area: Surface mine					
	1 HAZARD TYPE	2 Are any of these present / possible or	<sub>3</sub> ✓ if applies			
		considered?				
1	Dusts that can effect health such as silica	1.1 creation and/or accumulation of amounts sufficient to effect health	$\checkmark$			
		1.2 confined space exposures	No confined spaces on site			
		1.3 dust monitoring and analysis	$\checkmark$			
		1.4 other -				
2	Asbestos	2.1 asbestos on mine site includes naturally occurring and manufactured products	No asbestos on site			
c	WORK PREMISES DHSR cl 43 "ASBESTOS"	2.2 other -				
_		3.1 dust levels that effect operators visibility	$\checkmark$			
3	other dusts that can effect operations	3.2 dust levels that effect equipment	$\checkmark$			
		3.3 combustible dusts such as sulphide or coal				
			None on site			

#### **Risk Assessment:**

 Next, fill in the <u>LIKELIHOOD Level (column 4)</u>. Refer to Likelihood Level from the Risk Classification Sheet (<u>Table 1</u>). Think about how *Likely* the problem identified will happen.

2 Are any of these present / possible or considered?	<sub>3</sub> ✓ if applies	₄ Likelihood Level	₅ Reason for Selecting the Likelihood	6 Maximum Consequence	7 Risk Rating
1.1 creation and/or accumulation of amounts sufficient to effect health	$\checkmark$	L4			
1.2 confined space exposures	No confined spaces on site				
1.3 dust monitoring and analysis					
1.4 other -	$\checkmark$	<i>L</i> 3			

5. Write in the next column (column 5 Reason for selecting the Likelihood) the <u>REASON</u> for selecting this likelihood. This reason could be based on your knowledge of the mine's safety history, safety alerts, incidents at similar types of mines, etc.

2 Are any of these present / possible or considered?	<sub>3</sub>	₄ Likelihood Level	₅ Reason for Selecting the Likelihood	6 Maximum Consequence	7 Risk Rating
1.1 creation and/or accumulation of amounts sufficient to effect health	$\checkmark$	L4	Dust tests indicate no harmful effects		
1.2 confined space exposures	No confined spaces on site				
1.3 dust monitoring and analysis	4 m	<i>L</i> 3	Last dust test 3 years ago		
1.4 other -			0 - 0		

6. Fill in the <u>MAXIMUM CONSEQUENCE</u> column. Refer to the Consequence Level from the Risk Classification Sheet (<u>Table 1</u>). Think how serious, or what

would be the most likely *Consequence* to persons and/or the mine if that problem did in fact happen. Consider *consequence* independently of *likelihood.* 

2 Are any of these present / possible or considered?	₃ ✓ if applies	₄ Likelihood Level	₅ Reason for Selecting the Likelihood	6 Maximum Consequence	7 Risk Rating
1.1 creation and/or accumulation of amounts sufficient to effect health	$\checkmark$	<i>L5</i>	Dust tests indicate no harmful effects	C2	
1.2 confined space exposures	No confined spaces on site				
<ul><li>1.3 dust monitoring and analysis</li><li>1.4 other -</li></ul>	~	<i>L</i> 3	Last dust test 3 years ago	C2	

 Having determined the Likelihood (L1 – L5) and Consequence (C1 – C5), of the hazard select the <u>RISK RATING</u> from the Risk Matrix (<u>Table 2</u>). Write the level (High, Medium or Low) in the last column (Risk Rating).

<sup>2</sup> Are any of these present / possible or considered?	<sub>3</sub> ✓ if applies	₄ Likelihood Level	₅ Reason for Selecting the Likelihood	6 Maximum Consequence	7 Risk Rating
1.1 creation and/or accumulation of amounts sufficient to effect health	~	<i>L5</i>	Dust tests indicate no harmful effects	C2	Low
1.2 confined space exposures	No confined spaces on site				
<ul><li>1.3 dust monitoring and analysis</li><li>1.4 other -</li></ul>	~	<i>L</i> 3	Last dust test 3 years ago	C2	Medium

NOTE: This workbook may be modified to accommodate the mine's own risk management program. Mines should be consistent when using risk management programs and should use its own risk assessment (classification system) where appropriate.

**ACTION PLANNING** 

Where a hazard has been identified and assessed for risk, there is a duty to take action to eliminate the risk or, if elimination can not be achieved, minimise the risk.

After identifying the hazards and risk rating them, complete <u>Table 7 'Action Planning Sheet</u> (<u>Risk Assessment Summary</u>)' by:

### Carry out the following steps:

1. Using <u>Table 7</u>, fill in the item No. from column 2 of <u>Table 6</u>, starting with the hazards that have been identified as high, then the medium hazards and then finally the low risk hazards. Only enter the item number for the hazard in column 1 of <u>Table 7</u>.

₁ Item No.	2 ACTIONS for all HIGH / MEDIUM / LOW Risk Classifications (strike out which doesn't apply)
59.4	
59,6	

 Write down the actions required to control the hazards in the Actions Column (column 2). Use the <u>HIERACHY OF CONTROLS</u> (page 8) and select the best control possible. There may be controls already in place. Write these down and review these against the <u>HIERACHY OF CONTROLS</u>, and improve where possible. List other controls that may be missing.

₁ Item No.	2 ACTIONS for all HIGH / MEDIUM / LOW Risk Classifications (strike out which doesn't apply)
59,4	Install non slip flooring
	Supply appropriate footwear
	PPE Register
	Add footwear to inspection checklist
59.6	Fix broken steps to AS 1657
	Add stairs and ladders to inspection checklist

# 3. Nominate someone who will be responsible for ensuring that the actions for that hazard will be undertaken and record this in column 3.

2 ACTIONS for all HIGH / MEDIUM / LOW Risk Classifications (strike out which doesn't apply)	<sub>3</sub> Action by Whom
Install non slip flooring	J. Bloggs
Supply appropriate footwear	J. Citzen
PPE Register	J. Bloggs
Add footwear to inspection checklist	J. Bloggs
Fix broken steps to AS 1657	J. Citzen
Add stairs and ladders to inspection checklist	J. Bloggs

### 4. Put realistic target dates as to when the actions will be completed in column 4.

5. When the actions have been completed review those actions to ensure that they are appropriate and best control the hazard. If so, write in the completion date in column 5.

6. When you have completed the Action Planning stage go back to the cover sheet and complete the bottom section.

	COVE	R SHEET

This has now gone someway to recording and managing hazards at the mine site. However, it must be remembered that this is not a comprehensive list and there may be other hazards at your site that are not listed. Ensure any additional hazards are added to this workbook.

# HIERACHY OF CONTROLS

Hazard control often involves limiting the exposure of persons to risks or hazards. It is important that control measures are considered in the order providing the greatest effect.

When selecting a control for an identified hazard, always choose the highest measure of control possible.

In practice, it may be necessary to use a combination of the different approaches to control a hazard.

The following order is recommended:

Best Elimination		Is it possible to eliminate the hazard altogether?
Substitution		Is it possible to replace the substance or, equipment with something less hazardous?
	Isolation	Is it possible to stop persons from interacting with the hazard e.g. machine guarding, remote handling?
	Engineering	Where people have to interact with a hazard is it possible to engineer a less hazardous solution e.g. stairs instead of a ladder, ventilation devices, refuel machinery from the ground?
	Administrative	Is it possible to lessen the exposure of people through changing the way the job is done, rotating people through the job, administrative controls such as training, high risk permits?
Worst Control	PPE	Last resort – is PPE appropriate to the type, level of hazard and has it been selected correctly?

# **RISK CLASSIFICATION SHEET**

### METHOD TO CLASSIFY RISK:

	TABLE	1 Ris	k = Likelihood (Probal	bility)	x Consequence	
	Ste	p 1 Assess th Likelihood		Step 2 Assess Consequence	the es	
L1	Happens every time we operate	Almost Certain	Common or repeating occurrence	C1	Fatality	Catastrophic
L2	Happens regularly (often)	Likely	Known to have occurred "has happened"	C2	Permanent disability	Major
L3	Has happened (occasionally)	Possible	Could occur or "heard of it happening"	C3	Medical/hospital or lost time	Moderate
L4	Happens irregularly (almost never)	Unlikely	Not likely to occur	C4	First aid or no lost time	Minor
L5	Improbable (never)	Rare	Practically impossible	C5	No injury	Insignificant

Once the likelihood L1 to L5 (Table 1 Step 1) and consequence numbers C1 to C5 (Table 1 Step 2) are selected, a single Risk Rating can be selected from the risk Matrix (Table 2) below:

TABLE 2Risk Matrix

Example: Likelihood is L2, Consequence is C2, and then Risk Rating is 5 or HIGH.
